Cyber farming?

Thanks to FieldServers farmers will be able to find out exactly what crop they should sow for the best results at the click of a mouse.

■ Suchalee Pongprasert
THE NATION

It's a hot day. The sun is shining brightly in a cloudless sky. To find out if there will be a drought, a farmer logs on to the Internet to check out the latest weather reports. With the advancing technology and the near-completion development of an agricultural data warehouse, which covers such issues as the amount of rainfall by area, humidity, wind, fertility of soil in given locations and so on, farmers and agriculturists nationwide will soon be able check if their land is likely to experience flooding, as well as which plants are most likely to flourish.

To access the data, all the farmers will have to do is go to the nearest Internet cafe or access point, select the data relevant to their area and wait for the information requested to pop up on the screen.

For example, instead of growing corn, agriculturists may learn that their land is actually more suited to crops like sugar cane, tapioca, pineapple or other fruit and vegetables. Since the quality of soil as well as the weather in each area is different, the correct information will protect them against planting inappropriate crops.

Thanks to the National Electronics and Computer Technology Centre (Nectec), this vision will soon become a reality. The Nectec team is currently working on a concept called tele-metering with the aim of building an Internet-based data bank that covers rainfall, irrigation, local natural resources and other issues that affect crops in all of rural Thailand.

Under the tele-metering plan, a number of wireless Internet-based devices known as FieldServers will be installed to collect agriculture-related data. This will then be processed at the centre. The final information will not only be used by government agencies to formulate planning and policies that effectively support planting in each zone, but will also be simplified to make it understandable to farmers.

Designed as an automatic monitoring system, the FieldServer, which is a lamp-like device, made of a CPU with a Web browser, and sensors that collect infrared data as well as air temperature, relative humidity, solar radiation, soil and leaf moisture and amount of rainfall and more.

The system also includes Wi-Fi (wireless fidelity) using 802.11b. This provides wireless transmission at 11

megabits per second and transfers information through the network to the server at the centre.

Digital and web cameras can be attached and remotely controlled via the web browser.

By installing the FieldServers in fields, yards or even streets, real-time data such as weather conditions and images at any given place can be automatically monitored.

This will help us get an enormous amount of data from all areas nationwide without the need to send people out to the field. More importantly, it allows us to call up data from a certain date and time and process it along with other information," Nectec's director Thaweesak Koanantakool says.

In addition to checking information relevant to their area, farmers can also seek data on neighbouring communities or nearby provinces, to check if weather conditions such as heavy

rainfall will affect their community or province as a whole.

At the same time, the move will also allow the government agencies to more effectively manage the development of agricultural, forestry, environmental and ecological projects.

Tele-metering is part of Nectec's Agricultural Information Network (AIN) joint project with the Agriculture and Agricultural Cooperatives Ministry and the Bank of Agriculture. The aim is to integrate agricultural information from a variety of sources into a single database thus enabling farmers to check weather reports, crop prices and other vital information.

"Even having just one device in a tambon is sufficient to make a comprehensive data bank," says Thaweesak.

To encourage people in all farming communities to access the informa-

tion provided on the network, the Net Tambon project that delivers Internet access to people in more than 70,000 tambon nationwide will become the access point. The portal - www.siamvillage.net - will also make the information easy to understand.

And since the device can be turned into a hotspot when connected to the Internet, Nectec says it will allow people to get access to the online information with even more ease. It hopes that the devices will potentially help reduce the "digital divide".

In order to make the number of FieldServer devices available in all rural areas, Nectec plans to develop and produce the device locally rather than rely on imports.

The centre will, however, link up with the National Agricultural Research Organisation (Naro) in Japan, which has considerable expertise in producing the device to transfer technology and know-how to researchers and developers in the country.

As a first step, Nectec aims to develop the FieldServer prototype before distributing the relevant information to potential local manufacturers who in turn will produce the devices and sell them to users at a relatively cheap price. In Japan, the device costs about US\$200 (฿8,500).

"We will work on the design and develop about five to six prototypes before handing the research to the private sector," says Thaweesak. suchalee@natiengroup.com

HAI'S Telemetry System

INSPIRED BY NARO's Field Server

TELEcommunication

Land line phone * Cellular Fiber *
Radio * 3/4G * Satellite * WiFi *
LoRa * NB-IoT

METERING

Rain, Temperature, Humidity,
Pressure, Solar intensity,
Wind speed & direction,
Water level, Salinity

HAI's Telemetry System

2004, HAI's Telemetry System adopted the ideas of "Field Server II" from NARO (National Agriculture and Food Research Organization), Japan. Since then, we further developed our 1st Telemetry System and deployed in remote areas.

YRS

CONTROLLER

TELECOM

SENSOR

2004 - 2005

- TCP/IP data transfer
- Web service data monitoring

- Precipitation, Temp , RH
- Solar radiation

2006 - 2008

- 10 – 60 mins data recording
- GPRS compatible

WAVECOM M1206 & Fago Maestro 100 (2G modem)

- FTP data transfer
- Modem configure by SMS

- Precipitation, Temp , RH
- Solar radiation, Wind

2009 - 2012

- USB data recording
- Solar cell ECU

Cinterion TC65

- FTP data transfer
- Modem & RTU configure by SMS, OTA firmware upgrade
- 2 ways communication

- Precipitation, Temp , RH
- Solar radiation, Wind
- Water level (Radar)

2013 - 2015

- Circuit Unit for GPRS Modem
- Circuit Unit for A2D

Gemalto (3G Modem)

- FTP data transfer
- Modem & RTU configure by SMS, OTA firmware upgrade
- 2 ways communication
- SkyWave (Satellite)

- Precipitation, Temp , RH
- Solar radiation, Wind
- Water level (Radar)
- Salinity

2016-2018

- New Model 2016
- GPS position receiver
- GPS clock sync.
- Compact design

Gemalto (3G Modem)

- MQTT protocol data transfer
- Internet of Things (IoT)

- Digital sensors
- High accuracy and stability
- Fan-aspirated radiation shield
- Accurate air temperature and humidity measurement

HAII'S Telemetry System

➤ HAII's Telemetry System is able to measure several HYDRO-MET parameters, e.g., water level, precipitation, temperature, humidity, and pressure.
